## 1. General Information.

All reactions sensitive to air or moisture were carried out under an argon atmosphere and anhydrous conditions unless otherwise noted. Dry solvents were purchased and used without further purification and dehydration. All reagents were purchased and used without further purification. Analytical thin layer chromatography was carried out on Merck silica $60 \mathrm{~F}_{254}$. Column chromatography was carried out with silica gel 60 N (Kanto Chemical Co.). HRMS were reported on the basis of TOF (time of flight)-MS (LCMS-IT-TOF; Shimadzu), and EB (double-focusing)-MS. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded with a 5 mm QNP probe at 400 MHz and 100 MHz , respectively. Chemical shifts are reported in d (ppm) with reference to residual solvent signals [ ${ }^{1} \mathrm{H}$ NMR: $\mathrm{CHCl}_{3}$ (7.26), $\mathrm{C}_{7} \mathrm{H}_{8}$ (2.08), $\mathrm{C}_{6} \mathrm{H}_{6}$ (7.16), $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (5.32); ${ }^{13} \mathrm{C}$ NMR: $\mathrm{CDCl}_{3}$ (77.0)]. Signal patterns are indicated as s , singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broad.
