14. General Information (Materials and Methods). Unless otherwise noted, all reactants or reagents including dry solvents were obtained from commercial suppliers and used as received. Solvents for spectrophotometry purchased from commercial suppliers were used for absorption and emission spectra. All reactions were carried out under an argon or a nitrogen atmosphere in dried glassware using standard vacuum-line technique, unless otherwise noted. All work-up operation and purification procedures were carried out with reagent-grade solvent in air, and analytical thin layer chromatography was carried out on Merck silica $60 \mathrm{~F}_{254}$ pre-coated plates. The developed chromatogram was analyzed by UV lamp (254 nm or 354 nm ). Flash column chromatography was carried out with silica gel 60 N (Kanto Chemical Co.). All melting points were recorded on the melting point apparatus of "Stanford Research Systems OptiMelt" and are not corrected. IR spectra were reported with a JASCO FT/ IR-6000 infrared spectrometer and the data are expressed in $\mathrm{cm}^{-1}$. High-resolution mass spectra (HRMS) were determined on the basis of TOF (time of flight)-MS (MADITOF or LCMS-IT-TOF), and DART (Direct Analysis in Real Time)-MS. Nuclear magnetic resonance (NMR) spectra were recorded on a JEOL JNM-ECZ400S (1 ${ }^{1} \mathrm{H} 400$ MHz and ${ }^{13} \mathrm{C} 100 \mathrm{MHz}$ ) spectrometer. Chemical shifts for ${ }^{1} \mathrm{H}$ NMR are expressed in parts per million (ppm) relative to $\mathrm{CHCl}_{3}(7.26), \mathrm{CH}_{2} \mathrm{Cl}_{2}$ (5.32), DMSO (2.50). Chemical shifts for ${ }^{13} \mathrm{C}$ NMR are expressed in ppm relative to $\mathrm{CDCl}_{3}(77.0), \mathrm{CD}_{2} \mathrm{Cl}_{2}$ (53.8), [D6]DMSO (39.5). Data are reported as follows: chemical shift, multiplicity (s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broad), coupling constants (Hz), and integration. All calculations were conducted using a Gaussian 16 suite program (G16RevC.02).[24] Optimization was performed at the B3LYP/6-31G(d,p). Harmonic vibration frequency analysis was conducted with the optimized structures at the same level of theory to verify all stationary points as local minima (with no imaginary
frequency). The computation was carried out using the General Projects on supercomputer "Flow" at Information Technology Center, Nagoya University.

DFT Calculation: All calculations were conducted using a Gaussian 16 suite program (G16RevC.01). Optimization was performed at the B3LYP/6-31G(d,p) level of theory. Harmonic vibration frequency analysis was conducted with the optimized structures at the same level of theory to verify all stationary points as local minima (with no imaginary frequency).

Cartesian Coordination of Optimized Structures: Cartesian coordinates for 1, optimized at the B3LYP/6-31G(d,p) level of theory.
